

***HIV is a virus, not a crime:
Criminal statutes and criminal prosecutions – help or hindrance?***

By
Edwin Cameron¹
Supreme Court of Appeal of South Africa
(with Scott Burris, Temple University Beasley School of Law, Philadelphia, Pennsylvania, and Michaela Clayton, AIDS and Rights Alliance of Southern Africa, Windhoek, Namibia)

1. Good morning, ladies and gentlemen. It is an honour to be able to share an important issue with you in this plenary today.
2. Let me tell you what I want to do in the next twenty minutes.
3. I want engage your minds, your feelings and your reactions, and I want to do so in three ways – through information, response and commitment:
 - First, I want to offer you information about one of the most serious issues in the epidemic at the moment – the use of criminal statutes and criminal prosecutions in the epidemic.
 - Then I will invite you to feel disquiet about what you know.
 - Lastly, I want us to consider resolving here, in this morning's session, to engage in positive action about the issue.
4. Let me start by taking you to three very different places – to Texas, to Zimbabwe and to Sierra Leone.
5. In Texas, just three months ago, a homeless man was sent to jail. He was convicted of a committing serious offence while being arrested for drunk and disorderly conduct – namely, harassing a public servant with a deadly weapon. Because of his past encounters with the law, the system ratcheted up the gravity of what he did, and he ended up being sentenced to 35 years in jail – of which he must serve at least half before he can apply for parole.²
6. Well, that's very sad, you might say, but what is our concern with the case? It is this. The man had HIV. The 'deadly weapon' he used against the public servant was his saliva. He was jailed because he spat at the officers who were arresting him.
7. After sentencing, Officer Waller is reported to have said he was elated with the jury's decision: 'I know it sounds cliché[d], but this is why you lock someone up ... Without him out there, our streets are a safer place.'³
8. Let's note some quick points about the case:
9. First, according to the most assured scientific knowledge we have, after nearly three decades studying the virus, saliva 'has never been shown to result in transmission of HIV'.⁴
10. So the 'deadly weapon' the man was accused of wielding was no more than a toy pistol – and it wasn't even loaded. Ratcheting up the criminal law because the man had HIV was thus inappropriate, unscientific and plain wrong.
11. Second, we must note the length of the sentence. Whatever his past conduct, it stuns the mind that someone who has not actually harmed anyone or damaged any property (or otherwise spoiled the world) could be locked away for 35 years.
12. The inference that his HIV status played a significant, probably pivotal, part in sending him away for so long is unavoidable. In short: the man was punished not for what he did, but for the virus he carried.
13. Let me take you now to violence-wracked Zimbabwe. There, a 26 year old woman from a township near Bulawayo was arrested last year for having unprotected sex with her lover. Like the homeless Texan, she was living with HIV. The crime of which she was convicted was 'deliberately infecting another person'.
14. The strange thing is, her lover tested HIV negative. The woman was receiving ARV therapy, so that is not surprising.⁵ Before sentencing her, the court tried to get a further HIV test from the lover – even though reportedly he didn't want to proceed with

¹ Apart from my co-authors, I am grateful to Beri Hull and the International Community of Women living with HIV and AIDS for their consultative input into this talk, as well as to Marlise Richter, and to her and Marc Lewis for PowerPoint skills I lack.

⁵ Swiss HIV clinical specialists recently released a consensus statement 'that individuals with HIV on effective antiretroviral therapy and without sexually transmitted infections (STIs) are sexually non-infectious'. See Vernazza P et al. 'Les personnes séropositives ne souffrant d'aucune autre MST et suivant un traitement antirétroviral efficace ne transmettent pas le VIH par voie sexuelle', *Bulletin des médecins suisses* 89 (5), 2008, available at http://www.saez.ch/pdf_f/2008/2008-05/2008-05-089.PDF (accessed 21 July 2008).

the charges at all.⁶ She was eventually sentenced to a suspended term of five years' imprisonment.⁷ The threat of imprisonment, and the shame and ordeal of her conviction, will continue to hang over her.

15. Let me tell you about the statute under which she was convicted, s 79 of the Zimbabwe Criminal Law (Codification and Reform) Act 23 of 2004. It is an extraordinary piece of legislation. It doesn't make it a crime merely for a person who knows that she has HIV to infect another. It makes it a crime for anyone who realises 'that there is a real risk or possibility' that she might have HIV, to do 'anything' that she 'realises involves a real risk or possibility of infecting another person with HIV'.
16. In other words, though the crime is called 'deliberate transmission of HIV', this is a misnomer. For you can commit this crime even if you do not transmit HIV. In fact, you can commit the crime even if you do not have HIV. You merely have to realise 'that there is a real risk or possibility' that you have HIV – and then do something – 'anything' – that involves 'a real risk or possibility of infecting another person'.
17. Stranger upon strange, this statute offers a defence when a person really does have HIV. In such a case, if the other person knew this, and consented, then the accused is exempt. But, the way the statute is drafted, this defence can not apply where the accused does not in fact have HIV, or does not know that she has HIV – by definition, in that case she cannot engage the informed consent defence by telling her partner she has HIV!
18. In short, this law creates a crime not of effect and consequence, but of fear and possibility.
19. What is more, the wording of Zimbabwe law stretches wide enough to cover a pregnant woman who knows she has, or fears she may, have HIV. For if she does 'anything' that involves a possibility of infecting another person – like, giving birth, or breast-feeding her newborn baby – the law could make her guilty of 'deliberate transmission – even if her baby is not infected.
20. In all cases, the law prescribes punishment of up to twenty years in prison.
21. In Sierra Leone, lawmakers have gone even further. They have avoided subtle lawyers' arguments about whether their law applies to pregnant women. So they have enacted a statute that removes all doubt. Their law also creates an offence of 'HIV transmission', though it too criminalises exposure to HIV, even without transmission.
22. The Sierra Leone law requires a person with HIV who is aware of the fact to 'take all reasonable measures and precautions to prevent the transmission of HIV to others' – and it expressly covers a pregnant woman.⁸ It requires her to take reasonable measures to prevent transmitting HIV to her foetus. No one doubts a mother's will and duty to take reasonable steps to protect her baby, but the law will make it more difficult for her to do so.
23. In addition, a person with HIV who is aware of this fact must not knowingly or recklessly place another at risk of becoming infected with HIV, unless that person knew of the fact and voluntarily accepted the risk. This, too, applies to pregnant mothers.
24. The provision criminalises not merely actual transmission of HIV from mother to child – but makes a criminal of any pregnant woman who knows she has HIV but does not take reasonable measures to prevent transmission to her baby.
25. I can carry on giving examples.
 - In Egypt, Human Rights Watch reports that men are being arrested merely for having HIV under article 9(c) of Law 10/1961, which criminalizes the 'habitual practice of debauchery [fujur]' – a term used to penalize consensual homosexual conduct in Egyptian law.⁹
 - In Singapore,¹⁰ a man with HIV has been sentenced to a year in prison for exposing a sexual partner to the virus – even though the risk to the partner (whom he fellated) was minimal, if not non-existent.
 - In Bermuda, a man with HIV who had unprotected sex with his girlfriend has been sentenced to ten years' imprisonment, even though he did not infect her.¹¹
 - In June 2008, the highest court in Switzerland held a man liable for negligently transmitting HIV to a sexual partner when he knew that a past partner had HIV, even though he believed, because he experienced no seroconversion symptoms, that he himself did not have HIV.¹²
26. These laws are stunningly wide in their application, and fearsome in their effects. They attack rational efforts to lessen the impact and spread of the epidemic with a sledge-hammer. They represent a rash phenomenon that is taking place world-wide:
 - law-makers are putting on the statute books new laws that create special crimes of HIV transmission or exposure – in Africa, the continent that carries the heaviest burden of the epidemic, at least a dozen countries¹³ have already adopted

¹³ In West, Central and East Africa, Benin, Burundi, Burkina Faso, Cabo Verde, Central African Republic, Chad, the Democratic Republic of Congo, Equatorial Guinea, Guinea, Guinea Bissau, Kenya, Mali, Mauritania, Niger, Sierra Leone and Togo have adopted similar laws, as has Tanzania. I am grateful to Richard Pearshouse of the Canadian HIV/AIDS Legal Network for updating this information to 31 July 2008. Criminal prohibitions targeting HIV already exist, according to the AIDS and Rights Alliance of Southern Africa (ARASA), in Lesotho, Swaziland and Zimbabwe, with calls to criminalise transmission of HIV in Namibia and Zambia (and

laws similar to the Sierra Leone law (though not all of them expressly include pregnant women) – many countries have done so with the proud help of an American-funded organisation;

- courts and prosecutors are targeting men and women with HIV for special prosecution.
- 27. These laws and prosecutions are creating a crisis in HIV management and prevention efforts – and they constitute one of the biggest issues in the epidemic right now.
- 28. Let us try to understand what lies behind criminalisation.
- 29. HIV is a fearsome virus, and its effects are potentially deadly. Public officials should be able to invoke any available and effective means to counter its spread. This includes criminal statutes and criminal prosecutions. Moreover, in the abstract and from a distance from social reality, there seems a certain justice that criminal penalties should be applied against those who negligently, recklessly or deliberately pass on the virus – even against those whose actions create only the risk of doing so.
- 30. African lawmakers and policy-makers, in particular, have reason to look for strong remedies. Many African countries face a massive epidemic with agonising social and economic costs: all effective means, including the mechanisms of the criminal law and criminal prosecutions, must be in-spanned.
- 31. In addition, many lawmakers are spurred especially by the plight of woman. Many (including very young women) are infected by unwary or unscrupulous men – they need especial protection, and a criminal statute may give best voice to their entitlement to protection.
- 32. But these reasons are bad. Bad. And they need to be countered, rationally, powerfully and systematically.
- 33. Let us start right here, this morning, by setting out the ten plainest reasons why criminal laws and criminal prosecutions make bad policy in the AIDS epidemic.
- 34. FIRST, criminalisation is ineffective. These laws and prosecutions don't prevent the spread of HIV. In the majority of cases, the virus spreads when two people have consensual sex, neither of them knowing that one has HIV. That will continue to happen, no matter what criminal laws are enacted, and what criminal remedies are enforced. Criminalisation will not stand in the way of the vast majority of HIV transmissions.
- 35. SECOND, criminal laws and criminal prosecutions are a shoddy and misguided substitute for measures that really protect those at risk of contracting HIV. We know what we need in this epidemic. After more than a quarter-century, we know very well. We need effective prevention, protection against discrimination, reduced stigma, strong leadership and role models, greater access to testing, and, most importantly, treatment for those who, today, this morning, are unnecessarily dying of AIDS.
- 36. AIDS is now a medically manageable condition. It is a virus, not a crime, and we must reject interventions that suggest otherwise.
- 37. I speak with passion about this, since nearly eleven years ago, in November 1997, my life was given back to me by anti-retroviral therapy. Since then I have been blessed to live a vigorous and productive life, and continue to enjoy excellent health with no few if any side-effects.
- 38. But I also speak without complacency and with a sense of fragile humility, since too many unnecessary deaths – especially in Africa – continue to occur.
- 39. We must focus on ending deaths, on ending stigma, on ending discrimination, on ending suffering. And on ending irrational, unhelpful and resource-reducing measures – like criminalisation.
- 40. For the uninfected, we need greater protection for women, more secure social and economic status, enhancing their capacity to negotiate safer sex and to protect themselves from predatory sexual partners. Criminal laws and prosecutions will not do that. What they do, instead, is to distract us from reaching that goal.
- 41. THIRD, far from protecting women, criminalisation victimises and oppresses and endangers them. In Africa most people who know their HIV status are female. This is because most testing occurs at ante-natal healthcare sites. The result, inevitably, is that most of those who will be prosecuted because they know – or ought to know – their HIV status will be women – like the Zimbabwe woman who now has a five-year prison sentence hanging over her.
- 42. As the International Community of Women living with HIV and AIDS has pointed out in a powerful consultation process, many woman cannot disclose their status to their partners because they fear violent assault or exclusion from the home. If a woman in this position continues a sexual relationship (whether consensually or not), she risks prosecution under the African model statutes for exposing her partners to HIV (even when she does not pass HIV on to him).
- 43. The material circumstances in which many women find themselves – especially in Africa – make it difficult and all too often impossible for them to negotiate safer sex, or to discuss HIV at all. These circumstances include social subordination, economic dependence and traditional systems of property and inheritance which make them dependent on men.
- 44. These provisions will hit women hardest, and will expose them to assault, ostracism and further stigma. They will become more vulnerable to HIV, not less.
- 45. FOURTH, criminalisation is often unfairly and selectively enforced. Prosecutions and laws single out already vulnerable groups – like sex workers, men who have sex with men and, in European countries, black males.
- 46. Women who are already marginalized, such as sex workers and drug users, are placed at risk of further targeting by government officials and agencies. This targeting is made more acute by the fact that, thus far, these laws have been relatively rarely applied. Such prosecutions as there have been, have resulted from individual and sometimes idiosyncratic decisions by

Uganda). In Lesotho, the Sexual Offences Act of 2003 criminalises wilful HIV transmission, as well as consensual sex where one of the parties fails to disclose his or her HIV status. See *HIV/AIDS and Human Rights in SADC – An evaluation of the steps taken by countries within the Southern African Development Community (SADC) region to implement the International Guidelines on HIV/AIDS and Human Rights* (2006), available at http://www.arasa.info/files/pub_HR%20report%202006%20final.doc (accessed 19 July 2008).

particular police officers and prosecutors. The fact is that, if we leave aside cases of deliberate transmission of HIV, the behaviour that is prosecuted – namely, sex between two consenting adults – is common. The prosecutions there have been have therefore been necessarily arbitrary.

47. FIFTH, criminalisation places blame on one person instead of responsibility on two. This is a hard but important thing to say. HIV has been around for nearly three decades. For nearly three decades the universal public information message has been that no one is exempt from it. So the risk of getting HIV (or any sexually transmitted infection) must now be seen as an inescapable facet of having sex. We cannot pretend that the risk is introduced into an otherwise safe encounter by the person who knows or should know he has HIV. The risk is part of the environment, and practical responsibility for safer sex practices rests on everyone who is able to exercise autonomy in deciding to have sex with another.
48. The person who passes on the virus may be 'more guilty' than the person who acquires it, but criminalisation unfairly and inappropriately places all the 'blame' on the person with HIV. It is true (as I have pointed out) that the subordinate position of many women makes it impossible for them to negotiate safer sex. When a woman has no choice about sex, and gets infected, her partner unquestionably deserves blame. But the fact is that criminalisation does not help women in this position. It simply places them at greater risk of victimisation. Criminalisation singles one sexual partner out. All too often, despite her greater vulnerability, it will be the woman. Criminalisation compounds the evil, rather than combating it.
49. SIXTH, these laws are difficult and degrading to apply. This is because they intrude on the intimacy and privacy of consensual sex. I am not talking about non-consensual sex. That is rape, and rape should always be prosecuted. But where sex is between two consenting adult partners, the apparatus of proof and the necessary methodology of prosecution degrade the parties and debase the law. The Zimbabwean woman again springs to our attention here: her lover wanted the prosecution withdrawn, but the law vetoed his wishes. It also countermanded her interests. The result is a tragedy for all, and a blight on HIV prevention and treatment efforts.
50. What is more, the legal concepts of negligence and even recklessness are incoherent in the realm of sexual behaviour, and incapable of truly just application. No one suggests that a person knowing he has HIV, who sets out intending to infect another, and achieves his aim, ought to escape prosecution (such deliberately stabbing someone with an injecting needle containing blood with HIV).¹⁴ He has set out deliberately to harm another and he has achieved his purpose as surely as if he had wounded his victim with a firearm or a knife.
51. But in cases where there is no deliberate intention, the categories and distinctions of the criminal law become fuzzy and incapable of offering clear guidance – to those affected by the laws and to prosecutors. Some laws target 'reckless' or 'negligent' transmission of or exposure to HIV. Others advocate criminalising 'reckless' transmission of or exposure to HIV. We know that the 'reasonable person' often has unprotected sex with partners of unknown sexual history in spite of the known risks – that's why we have an HIV epidemic, and that's why interventions to reduce unsafe sex are so important.
52. When it comes to sex, with its potent elements of need, want, trust, passion, shame, fear, risk and heedlessness, normal, reasonable people simply do not always follow public health guidelines. With the best of intentions, they may make assumptions (suggesting condom use = "I am HIV+"), avoid issues (no need to disclose if we just do oral sex), or just hope for the best. HIV is a risk, but it is balanced in both parties' minds by the possibility of pleasure, excitement, closeness, material or social gain, and maybe love. That, for better or worse, is customary – yes, reasonable – behaviour.
53. But in court, looking back (especially looking back at an encounter where the worst outcome happened), a different standard is applied.
54. As Matthew Weait's insightful account of British prosecutions has shown¹⁵, the risk of HIV is treated as inherently unreasonable, and the decision of the putative victim to run the risk is rendered irrelevant by doctrines that require disclosure.
55. It is simply unfair to judge people, particularly a more or less arbitrarily selected small segment of the population, by legal standards of sexual behaviour that bear little relation to the standards of behaviour in real life.
56. SEVENTH, many of these laws are extremely poorly drafted. Partly because it is difficult to prove an offence that involves consensual sex, and because of the difficulties of applying the categories of the criminal law, many of these laws end up being a hodge-podge of confused legislative intent and bad drafting.
57. For instance, under the 'model law' that many countries in east and west Africa have adopted,¹⁶ a person who is aware of being infected with HIV must inform 'any sexual contact in advance' of this fact. But the law does not say what 'any sexual contact' is. Is it holding hands? Kissing? Or only more intimate forms of exploratory contact? Or does it apply only to penetrative intercourse? The law does not say.
58. What it also does not say is what 'in advance' means. Must it be before any sexual contact is initiated? Or is it only before actual intercourse occurs? Will people be prosecuted for intimate conduct intended to lead up to intercourse? We do not know. The laws do not say. Worse, millions of West and East Africans who must now live their lives under fear of prosecution by this law do not know.
59. The 'model' law would not pass muster in any constitutional state where the rule of law applies. The rule of law requires clarity in advance on the meaning of criminal provisions and the boundaries of criminal liability.

¹⁴ Richard Elliot 'Criminal Law, Public Health and HIV Transmission: A Policy Options Paper', UNAIDS Best Practice, Geneva, Switzerland, June 2002, available at http://data.unaids.org/publications/IRC-pub02/JC733-CriminalLaw_en.pdf (accessed 31 July 2008).

¹⁵ Matthew Weait, *Intimacy and Responsibility: The Criminalisation of HIV Transmission*, London and New York: Routledge-Cavendish, Glasshouse, 2007.

¹⁶ An example of its enactment is section 24 of Kenya's HIV/AIDS Prevention and Control Act of 2006.

60. But who will venture to challenge the laws as they have been enacted in eleven countries? Perhaps there will be challenge in Kenya. But until someone does, the terrifyingly vague provisions remain on the statute books.
61. EIGHTH, and perhaps most painfully to those of us living with HIV, criminalisation increases stigma. From the first diagnosis of AIDS 27 years ago, HIV has carried a mountainous burden of stigma. This has been for one over-riding reason: the fact that it is sexually transmitted. No other infectious disease is viewed with as much fear and repugnance as HIV is.
62. Because of this, stigma lies at the heart of the experience of every person living with or at risk HIV.
63. It is stigma that makes those at risk of HIV reluctant to be tested; it is stigma that makes it difficult – and often impossible – for them to speak about their infection; and it is stigma that continues to hinder access to the life-saving ARV therapies that are now increasingly available across Africa.
64. Legislators bewildered, or baffled, or at a loss as to how to respond effectively to the epidemic may be seduced into taking recourse to criminalisation, because it seems attractive, effective and media-friendly.
65. But it is not prevention- or treatment-friendly. It is hostile to both.
66. This is because, tragically, it is stigma that lies primarily behind the drive to criminalisation. It is stigma, rooted in the moralism that arises from the sexual transmission of HIV, that too often provides the main impulse behind the enactment of these laws.
67. Even more tragically, such laws and prosecutions in turn only add fuel to the fires of stigma.
68. Prosecutions for HIV transmission and exposure, and the chilling content of the enactments themselves, reinforce the idea of HIV as a shameful, disgraceful, unworthy condition, requiring isolation and ostracism.
69. But HIV is a virus, not a crime. That fact is elementary, and all-important. Law-makers and prosecutors overlook it.
70. We must fight this new burden of moralising stigma and persuade them of how wrong their approach is.
71. NINTH, criminalisation is a blatant dis-inducement to testing. It is radically incompatible with a public health strategy that seeks to encourage people to come forward to find out their HIV status. AIDS is now a medically manageable disease. Across Africa, the life-saving drugs that suppress the virus and restore the body to health are becoming increasingly available.
72. But why should any woman in Kenya want to find out her HIV status, when her knowledge can only expose her to risk of prosecution? The laws put diagnosis, treatment, help and support further out of her reach.
73. By reinforcing stigma, by using the weapons of fear and blame and recrimination, criminalisation makes it more difficult for those with or at risk of HIV to access testing, to talk about diagnosis with HIV, and to receive treatment and support.
74. We therefore have a dire but unavoidable calculus: these laws will lead to more deaths, more suffering and greater debilitation from AIDS.
75. Criminalisation is costing lives.
76. The International Community of Women with HIV and AIDS has rightly described laws like this as part of a ‘war on women’.¹⁷
77. They are not just a war on women. They are a war on all people with HIV, and they constitute an assault on good sense and rationality in dealing with the epidemic.
78. The rush to legislation has resulted in rash, inappropriate and in all too many cases excessive laws.
79. The laws often constitute an assault not just on civil liberties, but on rational and effective interventions in the epidemic.
80. And this brings us to the TENTH and last point, which is about belief, and hope – words all too seldom heard in this epidemic. Criminalisation assumes the worst about people with HIV, and in doing so it punishes vulnerability. The human rights approach assumes the best about people with HIV and supports empowerment.
81. As Justice Michael Kirby – who powerfully lights a pathway of justice and hope and reason in this epidemic – has argued, countries with human rights laws that encourage the undiagnosed to test for HIV do much better at containing the epidemic than those that have ‘adopted punitive, moralistic, denialist strategies, including those relying on the criminal law as a sanction’.¹⁸
82. The prevention of HIV is not just a technical challenge for public health. It is a challenge to all humanity to create a world in which behaving safely is truly feasible, is safe for both sexual partners, and genuinely rewarding.
83. When condoms are available, when women have the power to use them, when those with HIV or at risk of it can get testing and treatment, when they are not afraid of stigma, ostracism and discrimination, they are far more likely to be able to act consistently for their own safety and that of others.
84. The global consensus on human rights and the enabling environment captures this positive vision of HIV prevention. When compared with the punitive and angry approach embodied in criminalisation, is clearly more important now than ever.
85. The principal effect of criminalisation is to enhance stigma, fear, isolation, and the dread of persecution and ostracism that drives people away from treatment.
86. Let us use our plenary meeting this morning to send out a firm and clear message:–
- Criminalisation is a poor tool for regulating HIV infection and transmission;
 - there is no public health rationale for invoking criminal law sanctions against those who unintentionally transmit HIV or expose others to it;

¹⁷ Email communication from Beri Hull of ICW.

¹⁸ In an address to an international criminal law reform conference in Dublin in July 2008, Justice Kirby argued that ‘Those countries that have adopted a human rights–respecting approach to the HIV/AIDS epidemic have been far more successful in containing the spread of HIV than those countries that have adopted punitive, moralistic, denialist strategies, including those relying on the criminal law as a sanction’, quoted in *Poz* ‘Australian Judge Slams HIV Criminalization’ 18 July 2008, available: http://www.poz.com/articles/australia_judge_hiv_1_14936.shtml (accessed 23 July 2008).

- the sole rationale for criminalisation is the criminal law goal of retribution and punishment – but that is a poor and distorted aim for public health law;
- Criminalisation is in general warranted only in cases where someone sets out, well knowing he has HIV, to infect another person, and achieves this aim.

87. In other cases, we are left with the sad burdens, but also the hopeful initiatives, that are available to us in this epidemic.
88. Let today be the start of a campaign against criminalisation.
89. Let one of the conference outcomes be a major international push-back against misguided criminal laws and prosecutions.
90. Let us return to our countries, determined to persuade law-makers and prosecuting authorities of the folly and distraction of criminalisation. Let us return strengthened in our resolve to fight AGAINST stigma, against discrimination, and against criminalisation – and to fight FOR justice, good sense, effective prevention measures and for access to treatment.
